

5

- logging events by storing event attributes as an event set, wherein each event set includes a source attribute, a target attribute and an event category attribute;

classifying events as groups by aggregating events with at least one attribute within the event set as an identical value;

calculating severity levels for the groups;

20

25

2. The method of claim 1, wherein the severity levels are calculated based on at least one of the number of event sets within each of the groups, the source attribute of the event sets within each of the groups, the target attribute of the event sets within each of the groups, and the event category attribute of the event sets within each of the groups.

Docket No. AUS920010244US1

3. The method of claim 1, wherein the events include at least one of a web server event, an electronic mail event, a Trojan horse, denial of service, a virus, a network event, an authentication failure, and an access violation.

4. The method of claim 1, further comprising:

calculating the threshold value based on at least one of the source attribute of the event sets within the group, the target attribute of the event sets within the group, the event category attribute in each event set of the group, and the number of attributes in each event set of the group that are held constant across all of the event sets in the group.

5. The method of claim 1, wherein the target attribute represents one of a computer and a collection of computers.

6. The method of claim 1, wherein the source attribute represents one of a computer and a collection of computers.

7. The method of claim 1, further comprising:

aggregating a subset of the groups into a combined group.

Docket No. AUS920010244US1

8. A method, in a data processing system, of establishing a severity level for multiple groups of computers, comprising:

5 receiving a plurality of delta severity levels;

performing a first mathematical operation on the plurality of delta severity levels to form a new delta severity level;

10

if the data processing system is the top level of a hierarchy of servers, performing a second mathematical operation on the new delta severity level and a stored severity level to form a new severity level; and

15

if the data processing system is not the top level of a hierarchy of servers, propagating the new delta severity level to a higher-level correlation server.

9. The method of claim 8, wherein the first
20 mathematical operation is one of addition, arithmetic mean, and geometric mean.

10. The method of claim 8, wherein the second mathematical operation is one of addition, arithmetic mean, and geometric mean.

25 11. A computer program product in a computer readable medium for reporting security events, comprising instructions for:

Docket No. AUS920010244US1

logging events by storing event attributes as an event set, wherein each event set includes a source attribute, a target attribute and an event category attribute;

5

classifying events as groups by aggregating events with at least one attribute within the event set as an identical value;

10

calculating severity levels for the groups;

calculating delta severities from the severity levels; and

15

propagating the delta severities to a higher-level correlation server.

12. The computer program product of claim 11, wherein the severity levels are calculated based on at least one of the number of event sets within each of the groups, the source attribute of the event sets within each of the groups, the target attribute of the event sets within each of the groups, and the event category attribute of the event sets within each of the groups.

20

25 13. The computer program product of claim 11, wherein the events include at least one of a web server event, an electronic mail event, a Trojan horse, denial of service, a virus, a network event, an authentication failure, and an access violation.

US 2001/00244A1

Docket No. AUS920010244US1

14. The computer program product of claim 11, comprising additional instructions for:

calculating the threshold value based on at least one of the source attribute of the event sets within the group, the target attribute of the event sets within the group, the event category attribute in each event set of the group, and the number of attributes in each event set of the group that are held constant across all of the event sets in the group.

15. The computer program product of claim 11, wherein the target attribute represents one of a computer and a collection of computers.

16. The computer program product of claim 11, wherein the source attribute represents one of a computer and a collection of computers.

17. The computer program product of claim 11, comprising additional instructions for:

aggregating a subset of the groups into a combined group.

18. A computer program product in a computer readable medium, containing instruction code operable in a data processing system, comprising instructions for:

receiving a plurality of delta severity levels;

Docket No. AUS920010244US1

performing a first mathematical operation on the plurality of delta severity levels to form a new delta severity level;

5 if the data processing system is the top level of a hierarchy of servers, performing a second mathematical operation on the new delta severity level and a stored severity level to form a new severity level; and

10

if the data processing system is not the top level of a hierarchy of servers, propagating the new delta severity level to a higher-level correlation server.

15 19. The computer program product of claim 18, wherein the first mathematical operation is one of addition, arithmetic mean, and geometric mean.

20. The computer program product of claim 18, wherein the second mathematical operation is one of addition, arithmetic mean, and geometric mean.

20 21. A data processing system for reporting security events, comprising:

a bus system;

25 a memory;

a processing unit, wherein the processing unit includes at least one processor; and

wherein the processing unit executes the set of instructions to perform the acts of:

10

15

calculating delta severities from the severity levels; and

20

propagating the delta severities to a higher-level correlation server.

25

22. The data processing system of claim 21, wherein the severity levels are calculated based on at least one of the number of event sets within each of the groups, the source attribute of the event sets within each of the groups, the target attribute of the event sets within each of the groups, and the event category attribute of the event sets within each of the groups.

Docket No. AUS920010244US1

23. The data processing system of claim 21, wherein the events include at least one of a web server event, an electronic mail event, a Trojan horse, denial of service, a virus, a network event, an authentication failure, and an access violation.

24. The data processing system of claim 21, wherein the processing unit executes the set of instructions to perform the act of:

calculating the threshold value based on at least one of the source attribute of the event sets within the group, the target attribute of the event sets within the group, the event category attribute in each event set of the group, and the number of attributes in each event set of the group that are held constant across all of the event sets in the group.

25. The data processing system of claim 21, wherein the target attribute represents one of a computer and a collection of computers.

26. The data processing system of claim 21, wherein the source attribute represents one of a computer and a collection of computers.

Docket No. AUS920010244US1

27. The data processing system of claim 21, wherein the processing unit executes the set of instructions to perform the act of:

5 aggregating a subset of the groups into a combined group.

28. A data processing system for reporting security events, comprising:

10 a bus system;

a memory;

15 a processing unit, wherein the processing unit includes at least one processor; and

a set of instructions within the memory,

20 wherein the processing unit executes the set of instructions to perform the acts of:

receiving a plurality of delta severity levels;

25 performing a first mathematical operation on the plurality of delta severity levels to form a new delta severity level;

30 if the data processing system is the top level of a hierarchy of servers, performing a second mathematical operation on the new delta severity

Docket No. AUS920010244US1

level and a stored severity level to form a new severity level; and

if the data processing system is not the top level
5 of a hierarchy of servers, propagating the new delta
severity level to a higher-level correlation server.

29. The computer program product of claim 28, wherein the first mathematical operation is one of addition, arithmetic mean, and geometric mean.

10 30. The computer program product of claim 28, wherein
the second mathematical operation is one of addition,
arithmetic mean, and geometric mean.
